Homework #2

## Problem 1

Draw the state diagram of DFAs recognizing the following languages. Alphabet  $\Sigma = \{0, 1\}$ .

- a.  $A = \{w \mid w \text{ starts with } 0 \text{ and has odd length, or starts with } 1 \text{ and has even length}\}$

- b.  $B = \{w \mid w \text{ is any string except } 11 \text{ and } 111\}$

- c.  $C = \{\epsilon, 0\}$

## Problem 2

Example of set difference:  $A = \{0,01\}$ , and  $B = \{0,11\}$ . Then,  $A - B = \{01\}$ .

Prove that regular languages are closed under the set *difference* operation. That is, if  $A$  and  $B$  are regular languages, then,  $A - B$  is also a regular language.

*Hint:* One can prove the statement above by either (1) contradiction or (2) construction. For the proof, you may make use of the theorems that regular languages are closed under *union*, *intersection*, and *complement*

### ANSWER:

→ We know that  $A - B = \text{The intersection of } A \text{ and } B \text{ complement}$ . Also we know that regular languages are closed under union and under complement. That is ...  $A^C = \Sigma^* - A$

→  $A - B$  denotes the elements which exists in  $A$  but not in  $B$

$L(A)$ :

$A = \{\text{empty, a, b, aa, ab, bb, ...}\}$

$L(B)$ :

$B = \{\text{ab, aab, abb, aabb, ...}\}$

→ We can prove  $A - B$  is regular by applying proof by contradiction by assuming  $A - B$  is not regular and by taking all elements which belong in  $A$  and removing elements within  $B$ .

$L(A - B)$ :

$A - B = \{\text{empty, a, b, aa, bbb, ...}\}$

→ Since,  $A - B$  has an automata,  $L(A - B)$  is regular, hence proved.
