Homework #1

Problem 1

0.1 Examine the following formal descriptions of sets so that you understand which members they contain. Write a short informal English description of each set.

f. $\{n \mid n \text{ is an integer and } n = n + 1\} \dots$

→ **ANSWER: The set of all integers that are equal to one added to n , but no integer is equal to its successor — an empty set.**

e. $\{w \mid w \text{ is a string of 0s and 1s and } w \text{ equals the reverse of } w\} \dots$

→ **ANSWER: The set of all strings containing 0's and 1's and every string is a palindrome — a set of palindromic bit strings.**

0.6 Let X be the set $\{1, 2, 3, 4, 5\}$ and Y be the set $\{6, 7, 8, 9, 10\}$. The unary function $f : X \rightarrow Y$ and the binary function $g : X \times Y \rightarrow Y$ are described in the following tables.

d. What are the range and domain of g ? ...

→ **ANSWER: Range of $g = Y = \{6, 7, 8, 9, 10\}$... Domain of $g = X \times Y = \{(1, 6), (1, 7), (1, 8), (1, 9), (1, 10), (2, 6), (2, 7), (2, 8), (2, 9), (2, 10), (3, 6), (3, 7), (3, 8), (3, 9), (3, 10), (4, 6), (4, 7), (4, 8), (4, 9), (4, 10), (5, 6), (5, 7), (5, 8), (5, 9), (5, 10)\}$**

e. What is the value of $g(4, f(4))$? ...

→ **ANSWER: $g(4, f(4)) = g(4, 7) = 8$**

Problem 2

Prove the following formulas by mathematical induction. For each solution, please specify your (1) base case, (2) induction hypothesis, and (3) the inductive step.

1. For all $n \in \mathbb{Z}^+$:

$$\sum_{i=1}^n \frac{1}{i(i+1)} = \frac{n}{n+1}$$

I. Base Case: Assume $n = 1$ and that the LHS and RHS will hold

$$\sum_{i=1}^1 \frac{1}{i(i+1)} = \frac{1}{1+1} = \frac{1}{2}$$

→ Hence, the base case hold for LHS and RHS for $n = 1$

II. Induction Step: Now, we will suppose this will hold for $n = k+1$

$$\sum_{i=1}^{k+1} \frac{1}{i(i+1)} = \sum_{i=1}^k \frac{1}{i(i+1)} + \frac{1}{(k+1)(k+2)} = \frac{k}{k+1} + \frac{1}{(k+1)(k+2)} = \frac{k(k+2)+1}{(k+1)(k+2)} = \frac{(k+1)^2}{(k+1)(k+2)} = \frac{k+1}{k+2}$$

→ Hence, the inductive step holds for $n = k + 1$, for all n that exists within \mathbb{Z}^+

III. Conclusion: By induction, the formula is proven.

2. For all $n \in \mathbb{Z}^+$:

$$1^3 + 2^3 + 3^3 + \dots + n^3 = \left[\frac{n(n+1)}{2} \right]^2$$

* Base Case: Take $n=1$

$$\Rightarrow 1^3 = \left[\frac{1(1+1)}{2} \right]^2 \cdot \left[\frac{1+1}{2} \right]^2$$

$\Rightarrow 1 = 1$

Hence, the base case holds

* Inductive Step: Take $n=k+1$

$$= 1^3 + 2^3 + 3^3 + \dots + (k+1)^3$$

$$= 1^3 + 2^3 + 3^3 + \dots + k^3 + (k+1)^3$$

$$= \left[\frac{k(k+1)}{2} \right]^2 + (k+1)^3$$

$$= \frac{k^2(k+1)^2}{4} + \frac{(k+1)^3}{1}$$

$$= \frac{(k+1)^2}{4} \left[\frac{k^2 + 4(k+1)}{1} \right]$$

$$= \frac{(k+1)^2}{4} \left[\frac{k^2 + 4k + 4}{1} \right]$$

$$= \frac{(k+1)^2}{4} \left[\frac{k^2 + 2k + 2k + 4}{1} \right]$$

$$= \frac{(k+1)^2}{4} \left[\frac{k(k+2) + 2(k+2)}{1} \right]$$

$$= \frac{(k+1)^2}{4} \left[\frac{(k+2)(k+2)}{1} \right] = \frac{(k+1)^2}{4} \left(\frac{k+2}{2} \right)^2$$

$$= \left[\frac{(k+1)(k+2)}{2} \right]^2 = \text{RHS. Hence proven!}$$
